Trigger|iO SysEx Update - Release Notes

The drum kit presets in this update are identical to the original Trigger|iO presets, except that the first preset ('kit 0') has been optimized for improved response with the included BFD Lite software.

Note: For proper integration of the improvements of this BFD Lite Preset, first RESET the BFD Lite Note Hit Options in the top of the Hit Options screen.

The following improvements have been to the BFD Lite Preset Kit# 0 of the Trigger|iO:

- Improved musical and dynamic snare response and snare rolls.
- Improved snare rim response. Good for rolls, flams, and rim-shots.
- Improved tom dynamics and rolling.
- Tom rims are now configured to trigger soft Tom hits.
- Inputs 8 & 9 have properly configured choking behavior with improved bow-zone response and dynamic settings.
- Input 4 has choke note set correctly to default BFD settings. Works with expansion Surge Crash with Choke / Ride with Choke.
- Input 10 used for Surge Ride Bell zone is now set to crash sound with very low gain which results in bell-sound via BFD's velocity layering. The 2nd zone uses a choke note for the Crash sound. Allows choking of bell sound.
- Crosstalk rejection is tight.
- Machine gunning rejection for kick drum, tom rims and snares.
- Improved hi-hat trigger response.
- Hi-Hat pedal transition response is smoother. Best when using BFD Lite "Tighten" controls suggested in Trigger|iO BFD Lite Preset Update Guide.
- Overall level and response playability improvements between triggers of entire kit using default BFD Lite kit.
